## Traditional Burnt Sand Mastic

Price Per Tub / Burnt Sand Mastic & Oil- Driers (2 part)

Supplied in two parts. Burnt Sand + Oil-Driers. Used to form joints between timber window and door frames and masonry or rendered masonry, traditional burnt sand mastic has been in use for at least 200 years. It hardens slowly but remains sufficiently flexible for the purpose. It adheres tenaciously to most surfaces.

It is made by roasting sand on a hot plate or in a small kiln and was originally mixed with oils, lead based driers<sup>1</sup> and crushed chalk. However for many years now, alternative natural driers have replaced the lead products.

Mastic fillets should be neat 20 – 25mm across the diagonal face, mastic should not be used to make up damaged arises or defective renders, these deficiencies should be repaired properly before mastic work commences. We supply stone repair materials and other lime products for repairing renders

Mastic does not require painting but if this is desired it should only be over painted once completely dry with linseed oil based paints.
